Bulgaria - CP-1b OA - Old age demographic protection ratio (contributors)

This indicator reflects to what extent the current working-age population is protected in old age. It is calculated as the number of current contributors to a social security institution providing benefits in old age as a proportion of the working-age population. This version of the old age demographic protection ratio might slightly understate the future level of protection, as some of those affiliated, but currently not actively contributing to an old age pension scheme, might still build up sufficient entitlements during working age.
