Towards a Universal Pension Protection Scheme

Ruth Alicia Lucio Romero

Summary

2010: Process of establishing a social security system that will allow the fostering of a universal, equitable and financially sustainable pension system:

- basic universal pension system;
- a contributory scheme. For approved exceptions only, a non-contributory scheme in which the State subsidizes the contributions of the poor;
- financing: individuals and employers. The initiative proposes a progressive and equitable State subsidy based on the income level of the contributors.

Milestones

1. Work with the President and the Cabinet for approval of the proposed reform.
2. Creation of the National Secretariat of Social Security.
5. Generation of administrative and organizational institutional conditions for the incorporation of the Ecuadorian population into the system.

Key actors: Government ministries, institutes of social security, trade unions and business organizations.

Coordination of actors: Carried out by the Ministry of Coordination and Social Development until the establishment of the Regulatory Institution.

Information on the Author

Ruth Alicia Lucio Romero, Team coordinator of social security reform in Ecuador, health expert for the Ministry of Health, coordinator and liaison with the Ministry of Health and the Ministry for the Coordination of Social Development.
BACKGROUND

SOCIAL SECURITY SCHEMES AND COVERAGE

Currently, only one fifth of Ecuadorians or one third of the economically active population is covered by one of the four social security schemes: the Ecuadorian Social Security Institute (Instituto Ecuatoriano de Seguridad Social, IESS), Farmers’ Social Insurance (Seguro Social Campesino, SSC), the Social Security Institute of the Armed Forces (Instituto de Seguridad Social de Fuerzas Armadas, ISSFA) and the Social Security Institute of the National Police (Instituto de Seguridad Social de la Policía Nacional, ISSPOL). Each scheme works independently and there is no coordination among them (graph 1).

The protection is largely guaranteed to those in formal employment. It does not cover the family except for very basic coverage in the case of the police and armed forces and farmers’ social insurance. Family coverage consists of access to health services within the network of the institute to which the contributing member belongs. In the case of the Ecuadorian Social Security Institute (IESS), membership is individual and has only recently been extended to children under six years of age and spouses, enabling them to access health-care services.

The principal challenge of the Ecuadorian social security system is its low coverage rate. Of the economically active population, the proportion of premium payers hovers around 35 per cent (table 1) so that out of 100 economically active persons, 65 do not pay social security premiums.

In the field of social protection for the poor, the State also provides (since 1998) a conditional cash transfer programme known as the Human Development Bond (Bono de Desarrollo Humano, BDH) for the elderly who do not have a pension

---

1 IESS administers the following programmes: the farmers’ social insurance (health-care and old-age benefits), individual and family health insurance, including cash benefits, job risk insurance, and general insurance for disability, old age and death.
and who are recognized as living in conditions of poverty. In 2008, pension assistance increased substantially, rising to US$35 per month per person and covering 371,000 elderly people.

Thanks to the incorporation of pension assistance, the number of people not covered by social security is now less than 50 per cent of the total population. Nevertheless, the coverage gap remains significant, especially in low-income quintiles, as shown in graph 2. On average, 31 per cent of the elderly are covered by pension assistance, 18 per cent by social security pensions and 1 per cent by both systems.

FINANCING, PROGRESS AND SUSTAINABILITY

As currently applied, the State subsidies for social security are highly regressive since they are concentrated in the wealthiest deciles of Ecuadorian society (table 2). The State transfers to the richest 20 per cent (9th and 10th income deciles) US$370 million annually as subsidies to pensions.

Therefore, for the Ecuadorian reform process, it is of primary importance both to increase coverage and to define a progressive system that will allow the funneling of subsidies to precisely those segments of the population in greatest need of assistance, thereby ensuring a more equitable system.

Another important issue relates to ensuring, through social protection measures, that population groups do not slip into poverty. In an analysis of the impact of social protection on poverty through its two main components, social security and social assistance (the Human Development Bond, BDH), it was reported that, under current policies, in 2009 the

country prevented about 11 of every 100 adults over 65 years of age from falling into poverty (graph 3).

**Social Security Contributions**

Currently, the financing of existing social insurance systems in Ecuador is borne by members and employers, and, in terms of pensions, it rests on a wide range of State contributions to civilian and police and Armed Forces schemes.

To maintain the level of required contribution, the 2010 social security budget has put forward a projection of 8.4 per cent of gross domestic product (GDP). This historic budget implementation, however, notes that between 20 and 30 per cent of what is planned in the budget

every year is not executed because of bureaucratic inertia. Furthermore, the health expenditures via the National Health System, projected at 2.2 per cent of GDP, should also be added to the social security budget. This brings the total budget for 2010 (graph 4) to 10.6 per cent of GDP. If 1.2 per cent is added for the Human Development Bond (BDH), the total becomes 11.8 per cent of GDP.

Within the social security budget, the highest percentage of the budget (about 52 per cent, on average) is concentrated on the pension sector (table 4). The het-

Bureaucratic inertia is responsible for the gap between what is planned and what is executed, particularly in sectors such as health care where the planned health services are not implemented. This is changing rapidly thanks to improvements and changes in the bureaucracy in some regions. For example, in the regions of Pichincha, Santo Domingo, Tsachilas and Esmeraldas, where the local administrations have recently changed, the problem of the delays in the payment of millions of dollars to service providers has been solved in one trimester.
The Initiative for Social Security Protection: Towards a Universal Pension Model

The initiative to expand the social protection system was not an unfamiliar topic in the debates of the last decade in Ecuador, but it was not until the new government came into office in 2008 that a Constitutional provision for a universal model was implemented.

The new Constitution includes among its main guidelines the establishment of social security as an inalienable right. Executing and upholding this right constitute the duty and primary responsibility of the State, which is also responsible for legislating, regulating and controlling activities relating to social security and ensuring that it is a public and universal system.

Following the new legal and policy framework, President Correa and the political movement that supports him are the drivers of the social security reform in Ecuador today. In order for the reform to be successful, it is necessary to put forward the creation of an organic law to incorporate the different laws that govern each system, allowing the changes that had been needed by the Ecuadorian social security system in the last several decades to take place. Within this framework, a key element among those necessary to guarantee continuity in time is maintained, although the political conditions for approval are just developing.

The purpose of the social security system, through mandatory universal insurance, is to provide coverage to the entire population — regardless of employment status — for contingencies such as sickness, maternity, paternity, occupational hazards, dismissal indemnity, unemployment, old age, invalidity, disability and death.

Political Feasibility

In Ecuador, this is the first time in several decades that a government is able to come to power and promote a comprehensive structural reform of social security. This being a topic whose definitions are usually anchored in lobbyist groups, the majority of past governments chose not to alter even minimal elements of the system’s structure. The government of Rafael Correa counts among its assets the following: the President’s popularity; the evident political will to reform the country; the experience in implementing and reforming other complex issues in Ecuadorian society; and the emergence of previously unseen conditions such as a majority in parliament and independent and reliable technical institutions. These factors make the approach seem serious, relevant and politically feasible.
It is necessary to point out that the guidelines outlined below are only preliminary guidelines that will probably still be subject to a number of changes during the technical analysis phase by the Office of the President, other members of the Cabinet and their technical teams.

Coverage Increases

At present, there are 1.8 million employees covered by the Ecuadorian Social Security Institute (IESS) while the Social Security Institute of the Armed Forces (ISSFA) reaches 37,700 affiliates and the Social Security Institute of the National Police (ISSPOL) 39,300.

The initiative to reform the social security system seeks to extend social protection in order to include all those who do not have access to social security. This initiative has two strategies: to aggressively increase the wage-earning contributory population (i.e., those who are not affiliated although their affiliation is compulsory) and to include contributory independent workers and poor people. The objective is to achieve universal coverage, in order to do so, compulsory and persuasive strategies and incentives have been carefully and specifically designed, with the aim being to impact Ecuadorian society as a whole.

Historically, the social security coverage has been expanding, especially for those layers of the population that have better working and living conditions given the institutional, administrative and legal designs in force in the institutions in charge of the issue. In the last two years in particular, the involvement of wage earners has been strong and estimates foresee the inclusion of between 5 and 10 per cent more people per year in the future.

In the current view, the progressive expansion of coverage towards universal coverage is seen as a key objective of the reform. Therefore, plans have been drawn up for the inclusion of independent workers in the social security system at a rate of coverage extension of 5 per cent per year in order to cover 70 per cent of independent workers, starting with a population of independent workers of 10 per cent in 2010. The possibility of setting more aggressive goals to complete the process in the next decade is also analysed.

On the other hand, an increase in the minimum coverage of the poor at a rate of 5 per cent per year has been planned in order to reach a coverage rate of at least 85 per cent of the poor population. However, since this part of the population is already included in the census, this group will become an easier one to target and recruit. This will consequently imply developing an effective mechanism to incorporate these new members into the system in a timely manner.

It should be noted that the developed modelling is far less ambitious and considers the inclusion of members as a
medium-term process of at least two decades (graph 5). Obviously, if the incorporation proceeds at a faster pace, this will only improve the likelihood of sustainability of the social security system.

In any case, the initial strategies to increase the population covered by social security predict the prioritization of interesting and flexible mechanisms that reflect an understanding of the groups that are to be included and their efficient recruitment. By 2040, it is hoped that at least 75 per cent of the Ecuadorian population will be included in the social protection system and that it will be possible to maintain this coverage in the following decades.

CONTRIBUTIONS

The proposal establishes the universalization of rights and contributions, therefore proposing to extend the contributory system by mandatorily incorporating the largest part of the population, even that part that lives in poverty and can contribute only minimally to a future retirement pension (graph 6). Only in the case of indigents would the State consider subsidizing 100 per cent of the contributions. In summary, the proposal puts forward a contributory scheme and, for approved exceptions only, a non-contributory scheme in which the State subsidizes the contributions of the poor.

The initiative establishes that, within the social security system, financing of the contributory pension scheme rests on individuals and employers. This highlights the possibility of eliminating, for the first time in decades, the 40 per cent State contribution to the system. It proposes a progressive and equitable State subsidy, based on the income level of the contributors, and whose approach will be examined at a later time.

The current contribution of the State to the pension scheme amounts to 40 per cent of total expenditure on pensions, which is equivalent to about 5.62 per cent of payroll. It will be replaced by the

Graph 5
Progressive coverage of the Ecuadorian population by the social security system.
current employer contributions for health insurance (3.41 per cent of payroll). The remaining 2.21 per cent of the required contribution is under analysis to delegate the contributions of employee, employer or State because the system requires the same general average premium (5.62 per cent) to adequately cover the financial needs of the fund pension.

In addition, in striving for balance in the social security system, the full financing of the health sector would become the sole responsibility of the State, which would commit to financially covering the amount needed for health coverage. This responsibility is made explicit in the Constitutional framework.

As well as implementing a supplementary contribution for pension coverage in general, the State should also contemplate the implementation of an equitable subsidy for those independent workers who are not able to earn an average income at least equal to the unified minimum wage (UBMW) – US$240 in 2010 – and whose minimum declared earnings correspond to 20 per cent of the UBMW.

Through the contribution meant to complement the declared income in an inversely proportional way and reach the minimum contribution quota, the State hopes to significantly impact the regressive nature of the subsidy, thereby achieving a significant improvement with respect to equity in Ecuadorian society as a whole (graph 7).

With regards to the social security schemes of the police and the Armed Forces, the proposal discussed above analyses the possibility of homogenization of these pension systems so that they will be comparable to the civilian scheme both in terms of contributions and benefits. However, it should be clear that, since these are closed systems with small population groups, the proposal will have to consider that State contributions are necessary.
for the systems to be sustainable.

After evaluating financial sustainabili-
ty, the State will have to be transparent in
revealing how much it contributes to each
scheme in order for the Ecuadorian peo-
ple to know the specifics of contribution
amounts. If this option is implemented, it
remains to be seen what the required tran-
sition period would be to unify contribu-
tions and what would happen to the indi-
vidual contribution of soldiers and the
national police, which at this point are
higher than civilian contributions.

**How Could the State Subsidize the System?**

The first thing to consider is that a new
obligatory regimen is being
created for the independ-
ents. In this initiative, inde-
pendent workers contribute
to the system only if they
earn an amount equal to at
least 20 per cent of the uni-
fied basic minimum wage
(UBMW). This is what will
be recognized as the mini-
imum income contribution
(MIC) (= $48 in 2010).
However, to calculate the
subsidy (i.e., the comple-
mentary part), a presumed
income must be estimated, which will be
at least 40 per cent of the UBMW (= $96). The presumed income will be the
basis on which to estimate the amount of
subsidies to be received (table 5).

In addition, with the purpose of mak-
ing the system equitable as a whole, a
general contribution of 9.74 per cent has
been established, whose division between
employer and employee is currently being
analysed.

In order to make the system equi-
table, an equal minimum pension for
employees and independent workers can-
not be established. To be able to comply
with the principle establishing that the

<table>

<td>$7.83</td>
</tr>
</tbody>
</table>
higher the contribution the higher the pension, the minimum pension is scaled depending on the number of contributions. According to this definition, in order to calculate the pensions of independent workers, a “presumed income” will be taken as a reference point, and it is on this basis that the values of the State subsidy and the pension are estimated, which directly recognizes the greater or lesser effort of the contributor, rewarding contributory efforts as a basic principle.

To understand the model proposed for the subsidy and estimations realized, the required variables and the subsidy formula are presented in table 6.

<table>
<thead>

</tbody>
</table>

On the basis of these formulas, a system is established in which the State subsidy is progressive and related to citizens’ efforts in making their contribution. The State contribution will be proportional to the level of income of the employees and higher for those layers of the population with fewer resources. Pensions are determined also by individual effort, therefore constituting a direct reward for the effort made. However, in an attempt to maintain not only an equitable system but also a fair one, the pension amount is established through estimation formulas in order to have a minimum pension that enables people to adequately carry on with their lives.

**Parametric Reform**

In addition to the issue of the reconfiguration of contributions and financial responsibilities, the possibility of establishing a set of minor parameter changes has been discussed. The aim of this would be to make the reform sustainable, taking into account the labour market structure and the labour history of Ecuador as well as international conventions. The proposal that has been worked
out to date is summarized in table 7.

### Financial Feasibility: Fiscal Efforts

The parametric reform discussed in the previous section predicts significant results in the national economy. Above all, however, it entails the possibility of rearranging the tax sources, which will contribute to the sustainability of a more comprehensive and less expensive social security system – less expensive for the

State and therefore for the Ecuadorean population (table 8).

With the changes that will be introduced, it is projected that the tax burden will be balanced in such a way that from 2030 onwards and with the help of the new model, the tax effort will increasingly distance itself from what would otherwise be required if a broader reform were not undertaken.

The reform thus proposes balance and ensures the sustainability of the pension system of Ecuador’s civilian population.

Thus, the reform is crucial not only for guaranteeing the fiscal sustainability of the universal social security system but above all for building a progressive system that protects the Ecuadorean population as a whole.

The analyses carried out to achieve advances towards a social security protection scheme have established the requirement of incorporating the existing social security institutions and articulating them in a single social security system. The analyses have also established the procedures that result in adaptations and extensions of functions carried out today to strengthen the system’s administrative capacity.

Therefore, Ecuador has the equipment and tools required although it will in time need more of these resources. Obtaining this boost in resources is feasible in the short term because of the existing human and financial resources. However, in the medium term, there is a clear need for human resources trained and specialized in the field of social security, which will be critical for driving the structuring and maintenance of the social security system.

**Institutions and Actors Involved in the Reform**

One of the positive outcomes of the system reform was the consolidation of the
technical discussion within a coordinator ministry, in this case the Ministry for the Coordination of Social Development. This allowed for a social vision and a positive response to the call for meetings and open dialogue among the financial, political and economic institutions of the country and the same institutions administering insurance, which traditionally have been difficult to engage with in dialogue.

This outcome also became a cornerstone for the future implementation of an organic law, which will implement the substantive elements proposed by the reform since the environment of technical consultation has already been generated. In the transition towards a social policy of guaranteed rights, this environment enables the consolidation of an institutional system with redefined roles and functions that establish the difference with the previous system and ensure the systemic functionality that is required.

The social security system was designed according to the following:

- the establishment of a national secretariat to enable the policy direction and guidance necessary for the consolidation of a real social security system as well as efficient management of each subsystem or scheme administrator;
- the creation of a single body administering the national database, whose registration as well as collection functions enable the necessary coordination (which was previously nonexistent); and
- requirements for monitoring and quality control that will be implemented in existing institutions, enhancing their control and monitoring role by facilitating efficient management of social security resources.

**Challenges**

In conclusion, social security is the basis and foundation on which social protection is articulated in Ecuador and on which all other human development programmes can establish levels of support and/or complementarity. Therefore, a successful reform is a strategic priority for the social policy of the country, which aims to deliver sustainable and equitable development for the decades to come.

One of the key challenges is the fact that although the reform is currently starting to be implemented in Ecuador, the preparation needed to achieve universal insurance, based on a segmented market, requires a close relationship between the model of economic growth and adjustments of the labour market that are generated by the model.

In addition, Ecuador’s major challenge will be to organize the system and avoid duplication of activities and subsidies so as to expand the coverage achieved by optimizing resources and ensuring that public funding is committed to those who need it the most in a redistribution operation unprecedented for the country.

Finally, the key challenge will be to
create, in a very short amount of time, a
culture of contribution and respect of the
law and not merely of public assistance
since the practice of favouritism is still
prevalent in Ecuador, particularly in the
field of social security. This will require
society to commit to a new learning peri-
od of co-responsibility and not patron-
age. The fostering of such a culture,
through the fundamental pillar of educa-
tion on social security, will make the pro-
posed reform significantly more viable.

The long months of preparations and
analysis have yielded many lessons, which
focus largely on anchoring arguments in
proven technical analyses. In this endeav-
our, having an open mind to collaboration
with experts on this issue and the appoint-
ment of specially trained teams have been
particularly important elements in taking
decisive and technically adequate steps to
meet these challenges.
